

Cybersecurity Operations Report

Generated on: 2026-08-14 17:58:11

1. Executive Summary

The current operational period reflects a significant workload with 116 total incidents, including 5 critical and 26 high severity events. There are 22 incidents actively open, indicating ongoing response efforts. Concurrently, the IT operations team is managing 150 total tickets, with 26 tickets remaining open and 36 categorized as high priority. The lack of formal ticket closures despite many resolutions, coupled with the absence of key performance metrics, points to areas requiring immediate attention for process improvement and risk mitigation.

2. Incident Overview

A total of 116 incidents were reported. Of these, 22 incidents are currently open, signifying active investigations or mitigation efforts. While 41 incidents have been resolved, only 19 have been formally closed, suggesting a potential discrepancy in incident lifecycle management. The incident breakdown reveals 5 critical, 26 high, 50 medium, and 35 low severity incidents, highlighting a diverse range of security concerns across the environment.

3. Critical Incidents

There are 5 critical incidents identified during this period. These incidents represent the highest level of threat and pose significant potential risk to the organization's assets and operations. Immediate and focused attention is required to ensure their swift containment and resolution to mitigate any severe impact. The status of these critical incidents should be a top priority for ongoing monitoring.

4. Incident Categories and Trends

The incidents are distributed across various severity levels, with 5 critical incidents and 26 high-severity incidents requiring priority attention. Medium-severity incidents account for 50 of the total, indicating a substantial volume of events that, while less immediately impactful than critical or high, still demand timely action. Additionally, 35 low-severity incidents contribute to the overall workload, emphasizing the breadth of security monitoring and response activities.

5. IT Operations and Ticket Handling

IT operations are currently managing a total of 150 tickets. Of these, 26 tickets are open, with a significant portion, 36, classified as high priority. An additional 65 tickets are medium priority and 40 are low priority. While 89 tickets have been resolved, it is important to note that zero tickets have been formally closed, which may indicate a gap in the final stages of the ticket lifecycle. The average resolution time for tickets is not currently being tracked, preventing a key performance indicator from being utilized.

6. Outstanding Issues and Risks

Several outstanding issues and potential risks are evident from the current metrics. The presence of 22 open incidents, particularly within the context of 5 critical and 26 high severity incidents, poses an ongoing risk. A notable concern is the lack of formal closure for any of the 150 tickets, despite 89 being resolved, suggesting a procedural gap that could lead to unverified fixes or compliance issues. Furthermore, the absence of an average resolution time metric hinders the ability to assess operational efficiency and identify potential bottlenecks in ticket handling.

7. Recommended Actions

Prioritize the immediate investigation and resolution of the 5 critical incidents and any outstanding high severity incidents to minimize organizational exposure. Implement and enforce a robust ticket closure process to ensure that all resolved tickets are formally closed, thereby reducing backlog and clarifying the true status of operational tasks. Establish a system for tracking and reporting the average resolution time for tickets to enable data-driven performance analysis and resource allocation, improving overall operational efficiency.
